CYBER THREAT ATTACK AND MITIGATION SIMULATION

Name: **Cherilyn C. Lamadora**

Activity: Cyber-Threat-Attack-and-Mitigation-Simulation-7.1

Date: **November 03, 2026**

Reflection Questions and Answers

1. What type of attack did you find most difficult? Why?

For me, phishing was the most difficult because I got confused about what action to choose. I thought using SIEM was the right answer but the simulation showed that enabling MFA was better. I learned that I should understand the attack first before choosing what to do.

2. Which mitigation strategy did you use most often?

I think I used SIEM the most because I chose it when I encountered suspicious activities. It helps check and analyze system logs so we can notice possible threats. I also learned that not all attacks can be handled using the same strategy.

3. How did the logs panel help you understand the attack?

The logs panel helped me see the results of my choices. I was able to check which answers were right and which ones I got wrong. It also helped me understand why some actions were better than others.

4. Why is quick decision-making important in cybersecurity?

Quick decision-making is important because cyberattacks can cause more damage if they are not handled right away. For example, malware can spread to other computers and attackers can steal important information. That's why we need to act quickly and choose the right solution.

5. What will you improve next time?

Next time, I will try to learn more about the different types of cyberattacks and their solutions. I also want to be more careful when choosing my answers especially when I encounter attacks that I am not familiar with. I know I still have a lot to learn but this activity helped me understand cybersecurity better.
